What is the IP Panic Button?

The IP Panic Button is a cutting-edge device that delivers essential information and alerts to local staff and emergency responders with just one press of a button. This crucial device enhances safety and peace of mind, making it an invaluable addition to other security measures.

The IP Panic Button is a Power over Ethernet (PoE) network device that requires IP connectivity and an annual service plan. In addition to its onboard panic button, it offers various optional indoor/outdoor button extenders to reach areas facing environmental or network challenges where the device itself can not be placed.

- **A Stand-Alone Network-Connected Device**
- **With an optional Button Extender**
- **A Shortcut Key on a Phone***

How the IP Panic Button works:

Upon pressing the IP Panic Button, one or more of the following actions may be initiated:

- **Emergency Call:** Automatically dials 911, delivering a pre-recorded message to emergency responders that includes location-specific details and a direct call-back number, and more.
- **Intercom Activation*:** Engages the room's intercom with the designated help center.
- **Email Notification:** Sends an email with location-specific information.
- **Text Alert:** Sends a text message containing essential location-specific details.
- **Public Announcement*:** Issues an alert via the PA system and speakerphones.
- **Silent Mode:** Operates in silent mode by bypassing the intercom and PA systems.

*An annual service plan is required with each IP Panic Button device.
Device may vary based on requirements, and other 1ov1 unified communication services, such as 911 Identifier™, may be required.
